

Turning Tiller Transaction Data into Business Insights

What the data tells us and where the strongest opportunities lie

Phase 2 · Analytical Readout

What can Tiller's data tell us about its business customers?

We explored five years of transaction, product, payment and store data to understand how business activity behaves, what useful patterns exist, and where the strongest analytical opportunities lie.

1.28M

Orders

3.92M

Order lines

1.4M

Payments

21

Stores

The dataset is large enough and sufficiently connected to investigate meaningful business questions.

Data validation confirmed sufficiently complete relationships for integrated analysis. Known quality considerations are documented separately.

One store generates 68% of all orders — but customers spend much less per order

Share of total orders by store

Average amount spent per order (€)

Store 4151 = 68% of all orders · €7.03 average spend per order · Other stores average €57.11

Transaction activity changes predictably depending on the day and time

Order volume by day of week

Weekly pattern

Sunday generates the most orders. Activity builds steadily through the week.

Order volume across the day

Daily peaks

Clear lunch and dinner peaks. The same weekday tends to behave similarly from one week to the next.

Orders become much more valuable as the number of items and customers increases

Average amount spent by number of items

Average amount spent by number of customers

1-2 items → €6.96 per order versus 11+ items → €111.24 per order

These are associations, not proof of causation. The composition of an order provides useful information about its value.

Product data shows clear category leaders — but the product structure needs cleaning

Top commercial categories by order-line volume

PRESSION alone

Accounts for 17.8% of order-line value (€3.62M).
Strong category concentration exists.

Top commercial categories by value

Taxonomy issue

12,145 products across 456 raw categories. 1.28M
“CONSIGNE / ORDER” lines are technical records,
not commercial products.

Four opportunities emerged from the exploration

01 Store Performance & Benchmarking

Help businesses understand how their performance compares with other locations.

Evidence: Large differences in volume and spending between stores.

02 Demand Forecasting

Help businesses anticipate future transaction activity.

Evidence: Clear daily/weekly patterns and recurring historical demand.

03 Product & Basket Insights

Help businesses understand product mix and purchasing behaviour.

Evidence: 12,145 products and strong category concentration.

04 Transaction Economics

Help businesses understand what is associated with higher-value orders.

Evidence: Larger baskets and customer groups have substantially higher order values.

Two opportunities currently stand out

Qualitative prioritisation based on Phase 2 evidence · Not a mathematical ranking

Opportunity	Evidence	Business relevance	Feasibility
Store Performance & Benchmarking	Strong	Strong	Strong
Demand Forecasting	Strong	Strong	Strong
Product & Basket Insights	Medium	Strong	Medium
Transaction Economics	Strong	Medium	Strong

Store Performance & Benchmarking and Demand Forecasting currently show the strongest combination of evidence, relevance and feasibility.

Phase 3 should take one of these opportunities and go deeper

01

Store Performance & Benchmarking

Potential question

How can businesses better understand and benchmark their performance across locations?

02

Demand Forecasting

Potential question

How accurately can future transaction demand be anticipated from historical activity?

Phase 2 has narrowed the search. Phase 3 now needs to answer one focused question.

From exploring many signals to answering one useful question

The goal is not to solve every opportunity.

It is to find one problem where the data can support a useful decision.
